SUMMARY

A Self-motivated, Enthusiastic Graduate student focusing on Autonomous vehicle development with a deep understanding of the vehicle's Perception, Robotics, and Artificial Intelligence, seeking an internship position to explore career options in the Autonomous Industry.

EDUCATION

Master of Science | Automotive Engineering | Clemson University | GPA - 3.39
Bachelor of Engineering | Mechanical Engineering | Pune University | GPA - 3.85

Aug 19-Aug 21
Aug 15-May 18

TECHNICAL SKILLS

- Programing Languages – Python, ROS, C++, C, MATLAB and Simulink, LaTeX.
- Software - TensorFlow, OpenCV, ROS Autoware, Carla simulator, PyTorch, Git, Network architecture, Gazebo, Rviz, Arduino, PTC Creo, Ansys.
- Other skills – Image Processing, Artificial Intelligence, Machine Learning, Embedded Software.

ACADEMIC PROJECTS

Behavior Cloning using Deep Learning on f1tenth platform in the simulation environment. **Nov-Dec 20**

- Developed python implementation of end-to-end learning using Nvidia's CNN model and CNN-LSTM model architecture and validated the performance in Gazebo using Robot Operating System (ROS) melodic.
- Tuned the hyperparameter to improve performance, such as keeping the car in the middle of the lane.

Segmentation of food images using region grow with active contouring in Visual Studio **Nov-Dec 20**

- Applied the rubber band model and balloon model to shrink and expand the contours, respectively.
- Produced GUI to use active contour by giving initial contour points using mouse clicks to make it more interactive.

International Conference on Intelligent Robots and Systems (IROS) F1tenth competition, Las Vegas **Sep-Oct 20**

- Implemented an advanced version of disparity extender by using LiDAR to change the vehicle perception and control the vehicle to follow the track, which resulted in smooth motion avoiding hitting other cars.

Turtlebot3 Simulation in Gazebo environment (ROS kinetic) **Mar-Apr 20**

- Executed python implementation of Autonomous navigation of Turtlebot3 with wall following and obstacle avoidance deploying digital PID. Line following with OpenCV and stop sign recognition using darknet YOLO ROS package. Human following utilizing leg detector and digital PID for motion, led to the conclusion of autonomous working of robots in the work environment.

RRT-A* vs. RRT* In A Static Traffic Environment for Urban Driving **Mar-Apr 20**

- Built simulation scenario of 8 vehicles in 3 unidirectional lanes in Tkinter and Pygame environment. Implementation of RRT-A* and RRT* and its performance comparison in python concluding RRT* is better than RRT-A*.

Autonomous Navigation on Road **Mar-Apr 20**

- Accomplished autonomous lane tracking, simultaneous road sign detection, communication and vehicle control, and HMI determination by applying camera calibration, Stanley controller, UDP communication, and deep learning in MATLAB.

Developed Semantic Segmentation with FCN-VGG16 on Cambridge dataset. **Mar-Apr 20**

- Trained the FCN-VGG16 architecture using pre-trained weights of VGG16 with training and testing examples of 311 and 56 samples with training and validation accuracy of 88% and 85.94%, respectively.

Adaptive cruise control (ACC) and Autonomous lane-keeping (ALK) implementation on RC vehicle **Nov-Dec 19**

- Programmed ACC and ALK using Arduino Uno with a model-based approach, Kalman filtering, and PID controller on an RC vehicle.

FMAE QBDC and ISNEE QUADTORC competitions **Jan 17-Oct 18**

- Design and manufacturing of an ATV. Facilitated the team and constructed steering and suspension, customized wheel assembly.
- Winner of QBDC 2017, Runner up QT 2017, Runner up QBDC 2018.

WORK EXPERIENCE

Graduate Research Assistant at Auto-AI lab – Clemson University, United States **Jan 21-July 21**

- Implementation of Edge AI using edge computing platform for various applications like drivable space segmentation for autonomous robots.
- Survey of research paper for ongoing research work of one of the Ph.D. students on monocular beam depth estimation by fusing sparse LiDAR beams (4 beams) and its implementation with hyperparameters changes.
- Execution of various algorithms on Amazon AWS Deep Racer using ROS framework.

CERTIFICATIONS

- The Complete Self-Driving Car Course - Applied Deep Learning | ROS for Beginners: Basics, Motion, and OpenCV | Visual Perception for Self-Driving Cars | Deep learning Coursera Specialization | State Estimation and Localization for Self-Driving cars | Autonomous Cars: Deep Learning and Computer Vision in Python | Learn Python Programming Masterclass.
